This invention relates to an apparatus for the manufacture of ramming projectiles by which a ramming tip at the base of the projectile is formed upon a hollow sphere by ramming compression. An apparatus of this type is known, for example, from the publication BULLETIN No. 2, VOL. 54, DEKTAKTENTA 20 B, Berlin, dated 1961. The known apparatus has an impact head comprising a hollow sphere and a ramming tip on the base of the hollow sphere. The hollow sphere is driven axially into the firing chamber of a projectile from which it strikes an inner surface of the firing chamber. The hollow sphere is then slid from the firing chamber through an aperture in the wall of the weapon and is driven out of the weapon. After a certain lead or delay, the hollow sphere is turned and, after further projecting through the aperture, is driven back into the firing chamber. For ramming, the hollow sphere is axially pressed into the end of the firing chamber using a ramming plunger which is moved within a cylinder bore so as to be fixed in a piston. The hollow sphere is turned to ensure that the tips of the ramming tip are deeply embedded in the end of the firing chamber and are in the form of a semi-lobular tip. German Auslegeschrift No. 1,253,899 discloses an apparatus having a ramming plunger which simultaneously forms the hollow sphere and the ramming tip. The ramming tip is moved along the bottom of the firing chamber to be in the form of a partial cavity corresponding to the firing chamber and a hollow sphere is formed in the firing chamber by axial pressing. The hollow sphere and the ramming tip are moved simultaneously in the firing chamber. In the apparatus known from the above-mentioned publication, the hollow sphere is pressed into the firing chamber in a time-consuming manner, since the ramming plunger with the ramming tip is moved along the bottom of the firing chamber. For this reason, the hollow sphere is formed of solid material, so that it can not be stamped in so far as the material cannot absorb sufficient 6d1f23a050
