Motorized vehicles, such as automobiles and trucks, include what is commonly referred to as a "cable start" system where the user manually pushes on a handle/shaft connected to a cable that extends from the starter motor up to the hood of the vehicle. The hood of the motor vehicle is released, and the starter motor that is mounted to the vehicle hood is activated causing the engine to begin running. The cables also provide a convenient way to disconnect the starter motor of the vehicle from the engine. Many motor vehicles include a starter motor switch that is used for disabling the starter motor when the ignition switch of the vehicle is in an "off" position. Typically, the starter switch includes a solid state sensor including a housing having electrical contacts and a cover that is attached to the housing by a hinge assembly. When the ignition switch is turned "on", the starter switch can be actuated and the electrical contacts are closed to "connect" the starter motor to a battery of the vehicle. The starter switch can then be detached and/or flipped open through the cover by the user to disconnect the starter motor and disable the starter motor from the vehicle battery. If the vehicle owner does not remember to disconnect the starter motor, the starter motor is always connected to the battery, making it difficult for the owner to remove the starter motor and start the engine. Further, if the starter motor
